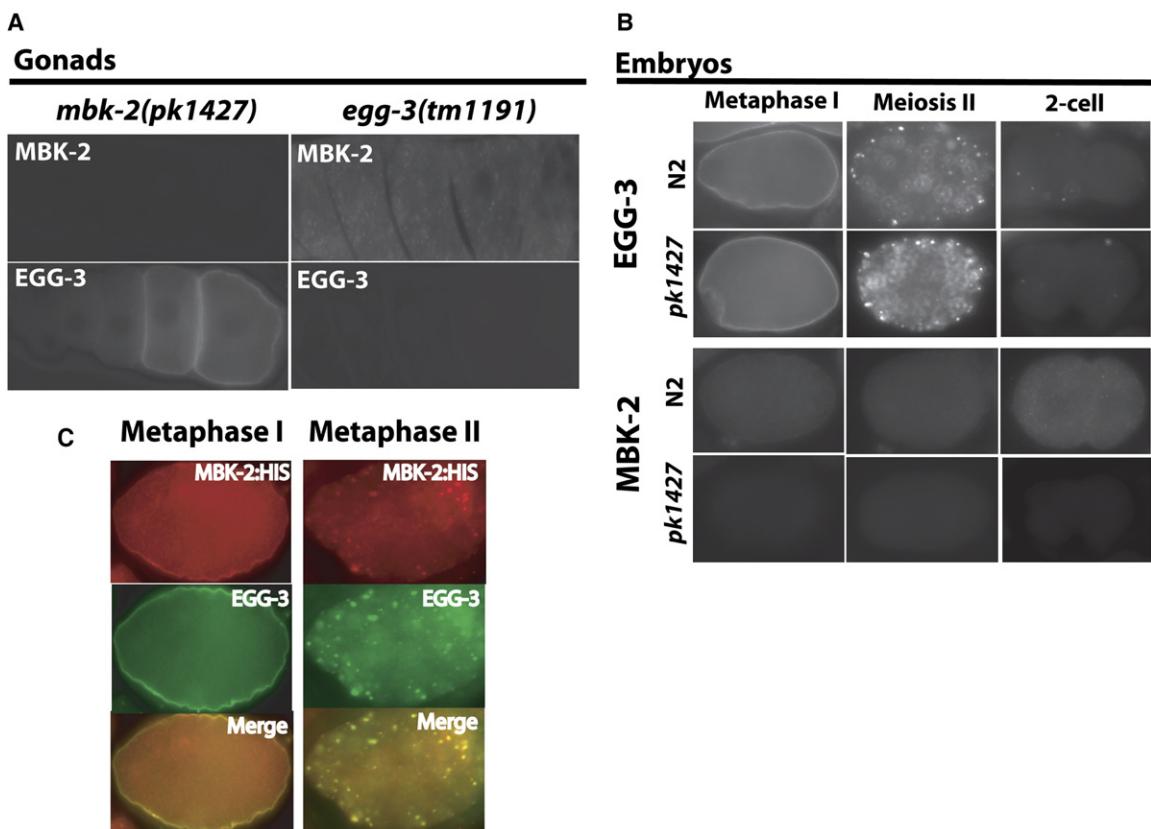

Figure S1. Immunostaining of Endogenous EGG-3 and MBK-2

(A) Fixed gonads from *mbk-2(pk1427)* or *egg-3(tm1191)* mutants immunostained with  $\alpha$ -MBK-2 or  $\alpha$ -EGG-3.

(B) Fixed wild-type or *mbk-2(pk1427)* embryos immunostained with  $\alpha$ -EGG-3 or  $\alpha$ -MBK-2 as indicated.  $\alpha$ -MBK-2 recognizes MBK-2 only weakly in embryos compared to oocytes (Figure 2).

(C) Fixed embryos expressing MBK-2:6xHis costained with  $\alpha$ -His and  $\alpha$ -EGG-3 as indicated.

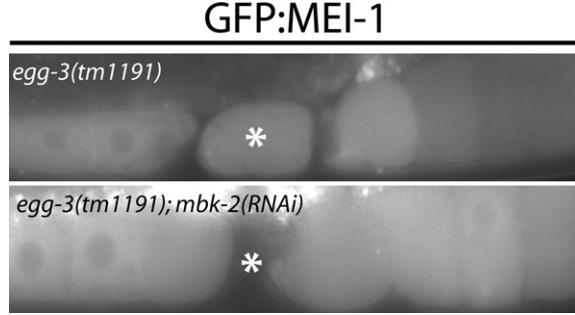

Figure S2. GFP:MEI-1 in *egg-3* Mutants

Live hermaphrodites of indicated genotype expressing GFP:MEI-1. Asterisk denotes spermatheca. Note that MEI-1 degradation in the *egg-3* mutant is dependent on MBK-2, as shown by the fact that GFP:MEI-1 degradation is delayed in *mbk-2(RNAi)*; *egg-3 (tm1191)*.

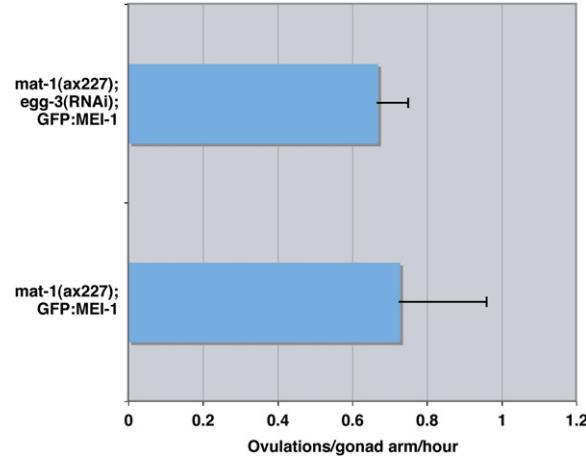

Figure S3. Ovulation Rates in *mat-1(ax227)* and *mat-1(ax227);egg-3(RNAi)* Hermaphrodites

Ovulation rates were determined as in [S1]. Data represent the average rate of ovulation  $\pm$  SEM detected in two (*mat-1*) or four [*mat-1;egg-3(RNAi)*] independent measures.
